## ABSTRACT

The present invention is a grappling hook for use in mooring boats. It has an elongated shank defining an axis and having first and second ends thereon. The shank has a mooring line fastened to the first end and a hook-shaped grasping end at the second end extending outward from the axis. The hook has a balance point on the shank where the weight of the first end equals the weight of the second end. To moor the boat, the hook is thrown therefrom over an obstruction by the mooring line and drawn toward the boat, and when the balance point on the shank reaches the obstruction, the force of gravity lifts the hook end from the obstruction and rotates it downward about the shank to engage the obstruction, making fast the boat.
